

Thyroxine Dosing

For patients aged **>60y** or those with **IHD**, start levothyroxine at 25–50µg daily and titrate up every 3 to 6 weeks as tolerated.

For ALL other patients start at full replacement dose. For most this will equate to **1.6 µg/kg/day** (approximately 100µg for a 60kg woman and 125µg for a 75kg man).
